3.1.1	Description	3
3.1.2	Results	3
3.1.3	Relevance And Cases In Real Systems	3
3.2	Cache Eviction Policies	3
3.2.1	Description	3
3.2.2	Results	3
3.2.3	Relevance And Cases In Real Systems	3
3.3	Store-Generated vs Always-Generate	3
3.3.1	Description	3
3.3.2	Results	3
3.3.3	Relevance And Cases In Real Systems	3
4	Findings And Discussion	4
5	Conclusion	5

1 Introduction

1.1 Background: Caches, Memory, Matrix Multiplication

1.2 Theoretical Results

1.3 Importance Of Asymmetric Data Access Model

2 Methodology

2.1 `asymm_tiling` Simulator

2.1.1 Our Model

2.1.2 Architecture

2.1.3 Correctness

2.2 Simulation Parameters: Soundness And Real-Life References

3 Experiments

3.1 C-Stationary vs B-Stationary

3.1.1 Description

3.1.2 Results

3.1.3 Relevance And Cases In Real Systems

3.2 Cache Eviction Policies

3.2.1 Description

3.2.2 Results

3.2.3 Relevance And Cases In Real Systems

3.3 Store-Generated vs Always-Generate

3.3.1 Description

3.3.2 Results

3.3.3 Relevance And Cases In Real Systems

4 Findings And Discussion

5 Conclusion
